

Herman Miller AO2 Retrofitting

Adding Stacking Glass Panels to Raise Height of Workstations

BEFORE

A local manufacturing company had a dilemma – how to adapt their existing Herman Miller AO2 workstations to meet company-mandated COVID-19 protocols so their staff could safely return to the office. Not satisfied with the options proposed by other furniture and plexiglass makers, they reached to the office reconfiguration experts at Office Furniture Center for a cost-effective solution.

Our team first met with their HR and facilities personnel to get an in-depth understanding of the scope of project. We next presented an option to raise the height of lower panels to full height using glass stacking units. Within a week of contract award, our design team produced a set of 2D and 3D line drawings of the “to-be” layout of all the workstations so the client could review and revise the plan as needed. Within three weeks of contract award, Office Furniture Center had all parts for over 100 workstations ready for delivery and install.

Office Furniture Center’s labor services division, MAC Relocations, performed the work to implement the changes to their existing workstations to the new configuration. In less than two weeks, MAC’s team of professional installers modified the stations to the new configuration. Over 1,000 parts were added or replaced. All work was done on-premises to minimize both cost and time; this also allowed client representatives to inspect the work and end product as it was being done. In less than 30 days from the time of first engagement, the Office Furniture Center team had completely transformed a non-compliant space into one that met all requirements allowing employees to safely return to the office.

“Office Furniture Center really came in clutch with their proposal to do the work. We were very unsatisfied with a number of other offers, and glad we kept on searching. Our stations look exactly like we hoped they would. I cannot thank OFC & MAC enough for their efforts.”
